

DATA ANALYST INTERVIEW ROADMAP

Technical + case study + company research + mock interview practice

Data Analyst interview aa raha hai? Sirf SQL questions practice karke mat jaana.

Prepare for the complete interview loop: technical questions, business cases, product sense, communication, company research and realistic mock-interview pressure.

Inside this guide:

- 01 Interview Query for complete data interview prep
- 02 Exponent for cases and communication
- 03 HackerRank for technical assessments
- 04 Glassdoor for company research
- 05 Interviewing.io + 30-day prep plan

Comment "INTERVIEW" to get all five websites and more resources.

1. Interview Query + Exponent

Use these platforms to move beyond isolated coding drills into role-specific questions, business problems, case studies and communication practice.

Interview Query

[Open Interview Query](#)

The Data Analyst prep page lists real questions, company interview guides, learning paths across SQL, product sense, ML and coding, an AI interviewer, peer mocks and coaching.

Interview area	Practice evidence
SQL + analysis	Explain assumptions, query logic and business meaning.
Product sense + metrics	Define a success metric and identify trade-offs.
Statistics / A-B testing	State hypotheses, validity risks and interpretation.
Company guides	Map expected rounds to a focused preparation plan.

Exponent

[Open Exponent](#)

Exponent describes courses, real interview questions, coaching, community and peer or AI mock interviews across roles including Data Science and ML.

Best for

Case studies, product or business questions, behavioural answers and communication practice.

Answer framework

Clarify → structure → analyse → recommend → acknowledge trade-offs.

2. HackerRank + Glassdoor

Prepare for the assessment format, then research the target company. Treat candidate-reported experiences as context, not guaranteed predictions of your exact interview.

HackerRank

[Open HackerRank](#)

HackerRank says developers use its community to certify skills, practise interviewing and discover jobs; its assessment products include role- and skill-based challenges.

Assessment habit	What to practise
Timed solving	Work under a realistic time limit.
Input / output checks	Read requirements carefully and test edge cases.
SQL clarity	Use readable logic and validate duplicate and null behaviour.
Communication	Write or explain the reasoning, not only the final answer.

Glassdoor Interview Reviews

[Open Glassdoor Interview Questions](#)

Glassdoor describes its interview section as a source of interview questions and reviews at companies.

Research checklist

Search role + company, note repeated round types, question themes and candidate advice.

Important caution

Past experiences vary. Use them to prepare broadly rather than memorising one reported process.

3. Interviewing.io + Mock Interview Loop

Mock interviews reveal communication gaps, time-management problems and pressure responses that are difficult to spot during solo practice.

Interviewing.io

[Open Interviewing.io](#)

Interviewing.io describes anonymous mock interviews, AI interview practice and feedback across coding, system design, machine learning and behavioural interviews. Its focus is broader than Data Analyst-specific preparation, so choose sessions relevant to your target role.

Mock interview feedback loop

Stage	What to capture
Before	Target round, question type and success criteria.
During	Structure, assumptions, calculations, SQL/code and communication.
Feedback	Technical gaps, unclear explanations and missed questions.
Retry	Repeat a similar question using the feedback.
Evidence	Keep a short log of errors and corrected responses.

60-second opening

Summarise your background, analytics strengths, relevant projects and role fit.

Closing questions

Prepare thoughtful questions about data maturity, stakeholders, success metrics and team workflow.

Practice principle

A strong mock is not one where everything goes perfectly. It is one that reveals exactly what to improve next.

4. 30-Day Interview Preparation Plan

Adjust the question count to your schedule, but keep preparation balanced across technical skill, business thinking, communication and company research.

Week	Focus	Output
Week 1	SQL, Python and statistics refresh.	Topic checklist + timed questions.
Week 2	Product sense, metrics and case studies.	Five structured case answers.
Week 3	Company research + technical assessments.	Company brief + assessment practice.
Week 4	Mock interviews + final revision.	Feedback log + improved answers.

Final interview checklist

☐	I can explain two projects end to end
☐	I can solve SQL under time pressure
☐	I can define and critique business metrics
☐	I can discuss basic statistics clearly
☐	I researched the company and role
☐	I practised behavioural stories
☐	I completed at least one mock interview
☐	I prepared relevant questions to ask

Interview Query	Open platform
Exponent	Open platform
HackerRank	Open platform
Glassdoor	Open interview reviews
Interviewing.io	Open platform
